

## **OERRM Vision DRAFT PROPOSAL**

OERRM supports the NIH mission as steward of medical and behavioral research for the Nation with the goal of improving the Nation's health. To fulfill this mission, NIH requires the ability to capture and manage biomedical and related data, to analyze, report, and communicate that data to the public and extramural communities, and to synthesize the data into information and knowledge that can help guide the management of the NIH portfolios of health research. Similarly, OERRM provides leadership supporting the grant-related functions of the Department of Health and Human Services Operating Divisions as well as the Federal Government.

OERRM supports OER in providing leadership that facilitates renewal of the grants-associated business processes by assisting NIH, OPDIVs and other agencies to define and refine the business architecture and systems to support its evolution on extensible and flexible Data, Application, Security and Technical architectures based on leading edge technologies and industry best practices. In order to enable the synthesis of data into knowledge, OERRM takes a holistic view of the research grant process from initiative planning through grant closeout.
